

Structured learning sessions, with learner-controlled Muse context.

PRODUCT DEFINITION

SlowSystems is a structured learning platform.

Teachers and learning coaches create plans, materials, assignments, knowledge checks, feedback, and repetition schedules.

Learners complete guided sessions and track progress through completed work, quiz results, reflection, and educational evidence.

OPTIONAL MUSE ROLE

User-controlled technical context.

- Adult learners only in phase one
- Device context remains learner-visible
- Official SDK access requested for review
- Local processing before session output
- No raw EEG to teachers or external AI

PHASE-ONE USE CASE

Adult learner, optional Muse device, learner-controlled technical context.

During a guided learning session, an adult learner may connect a Muse device. SlowSystems records connection status, signal quality, timestamps, recording continuity, and permitted signal features alongside task changes and manual markers. The information is shown only to the learner and does not determine grades, understanding, or coach feedback.

PLANNED LOCAL DATA FLOW

CLEAR PHASE-ONE BOUNDARY

SlowSystems does not:

- require an EEG device for the learning workflow
- include minors or institutional monitoring
- expose raw EEG or teacher-visible performance scores
- reproduce proprietary Muse scores
- provide diagnosis, treatment, or clinical support

INITIAL SDK SCOPE

Required for phase one

- permitted EEG data for local technical features
- timestamps, connection status, and signal quality
- .muse recording, logging, playback, and testing
- confirmation of Muse S Athena Android support

Optional later: Athena optics or fNIRS access. Not required for phase one.

PRIMARY REVIEWER QUESTIONS

1. Does the commercial Android SDK support Muse S Athena for standard phase-one functions?
2. If not, which current Muse model should be used for initial commercial evaluation?
3. What local processing, storage, closed-beta, screenshot, demo, and compatibility rules apply?
